

# Internet Technologies

Introduction to HTML and CSS - Part 3

Box Model, Positioning

University of Cyprus  
Department of Computer  
Science

# The CSS Box Model

- Every HTML element is composed of 4 layers:
  - the element's content
  - the **border** around the element's content
  - **padding** space between the content and border (inside)
  - a **margin** clears the area around border (outside)

# border

- Specify border (3 properties can be set – width, style, color – order does not matter)

- `border: solid;`
- `border: dashed red;`
- `border: 10px solid;`
- `border: 5px double #32a1ce;`

This is a box with a border around it.

This is a box with a border around it.

This is a box with a border around it.

This is a box with a border around it.

- Can also specify each border individually:

- `border-top`
- `border-bottom`
- `border-left`
- `border-right`

border: width style color;

```
<p>Welcome to CS425: Internet Technologies!  
In this course you will learn modern web  
development techniques.</p>
```

HTML

```
p {  
  border: 2px solid black;  
}
```

CSS

```
Welcome to CS425: Internet Technologies! In this course you will learn  
modern web development techniques.
```

# Rounded border

- Can specify the border-radius to make rounded corners:  
`border-radius: 10px;`
- You don't actually need to set a border to use border-radius.

```
p {  
  background-color: purple;  
  border-radius: 10px;  
  color: white;  
}
```

CSS

Welcome to CS425: Internet Technologies! In this course you will learn modern web development techniques.

# Borders look a little squished

- When we add a border to an element, it sits flush against the text:

Welcome to CS425:  
modern web develop

- Q: How do we add space between the border and the content of the element?

# padding

```
p {  
  border: 2px solid black;  
  padding: 10px;  
}
```

CSS

Welcome to CS425: Internet Technologies! In this course you will learn modern web development techniques.

- padding is the space between the border and the content.
  - Can specify padding-top, padding-bottom, padding-left, padding-right
  - There's also a shorthand (clockwise starting from top):
    - padding: 2px 4px 3px 1px;      <- top | right | bottom | left
    - padding: 10px 2px;            <- top&bottom | left&right
    - padding: 1px 2px 3px;        <- top | left&right | bottom

# <div>s look a little squished

- When we add a border to multiple divs, they sit flush against each other:

```
<div> Lectures </div>
<div> Homework </div>
```

HTML

```
div {
  border: 2px solid black;
  padding: 10px;
}
```

CSS

- Q: How do we add space between multiple elements?

# <div>s look a little squished

- When we add a border to multiple divs, they sit flush against each other:

```
<div> Lectures </div>  
<div> Homework </div>
```

HTML

```
div {  
  border: 2px solid black;  
  padding: 10px;  
}
```

CSS

- Q: How do we add space between multiple elements?

# margin

```
div {  
  margin: 20px;  
  border: 2px solid black;  
  padding: 10px;  
}
```

CSS

- margin is the space between the border and other elements..
  - Can specify margin-top, margin-bottom, margin-left, margin-right
  - There's also a shorthand (clockwise starting from top):
    - margin: 2px 4px 3px 1px;      <- top | right | bottom | left
    - margin: 10px 2px;            <- top&bottom | left&right
    - margin: 1px 2px 3px;        <- top | left&right | bottom

# margin

- Actually, why doesn't this:

```
div {  
  margin: 20px;  
  border: 2px solid black;  
  padding: 10px;  
}
```

CSS

- Look more like this?

# margin

- Actually, why doesn't this:

```
div {  
  margin: 20px;  
  border: 2px solid black;  
  padding: 10px;  
}
```

CSS

- Look more like this?

20px margin-bottom  
+ 20px margin-top =  
40px margin ?

# margin collapsing

- Sometimes the top and bottom margins of block elements are combined ("collapsed") into a single margin.
  - This is called **margin collapsing**
- Generally if:
  - The elements are siblings
  - The elements are block-level (**not** inline-block)
- then they collapse into **max(margin-bottom, margin-top)**.
- (There are [some exceptions](#) to this, but when in doubt, use the Page Inspector to see what's going on.)

# Negative margin

- Margins **can be** negative as well.
  - Example: negative margin on image:

```
<div id="header"></div>
<div id="profile">
  
</div>
```

HTML

```
#header {
  background-color: lightblue;
  height: 200px;
}
img {
  /* initially no negative margin*/
  margin-left: 50px;
  height: 65px;
  border: 2px solid lightgray;
}
```

CSS

# Negative margin

- Margins **can be** negative as well.

- `img { margin-top: -40px; }`

```
<div id="header"></div>
<div id="profile">
  
</div>
```

HTML

```
#header {
  background-color: lightblue;
  height: 200px;
}
img {
  margin-top: -40px;
  margin-left: 50px;
  height: 65px;
  border: 2px solid lightgray;
}
```

CSS

University of Cyprus  
Department of Computer Science

# auto margins

- If you set `margin-left` and `margin-right` to `auto`, you can horizontally center a block-level element with a specified width:

```
<div>                                     HTML
  This is a box of text
</div>
```

```
div {                                       CSS
  margin-left: auto;
  margin-right: auto;
  border: 2px solid black;
  padding: 10px;
  width: 300px;
}
```

# Moving things with **position**

- **Positioned layout** lets you define precisely where an element should be in the page ([mdn](#)).
- You can use positioned layout doing the following:
  1. Define a **position** method:  
static, fixed, absolute, relative
  2. Define **offsets**:  
top, left, bottom, right
  3. (optional) Define **z-index** for overlapping layers ([mdn](#))

# Moving things with **position**

- To specify exactly where an element goes, set its **top**, **left**, **bottom**, and/or **right** offset.
- The meaning of these offset values depend on the reference point set by position:
  - **static**: no reference point; static block **can't move** (this is the default style for every element)
  - **fixed**: a fixed position within the viewport
  - **absolute**: a fixed position within its "containing element"
  - **relative**: offset from its normal static position

# position: static

(nothing happens!)

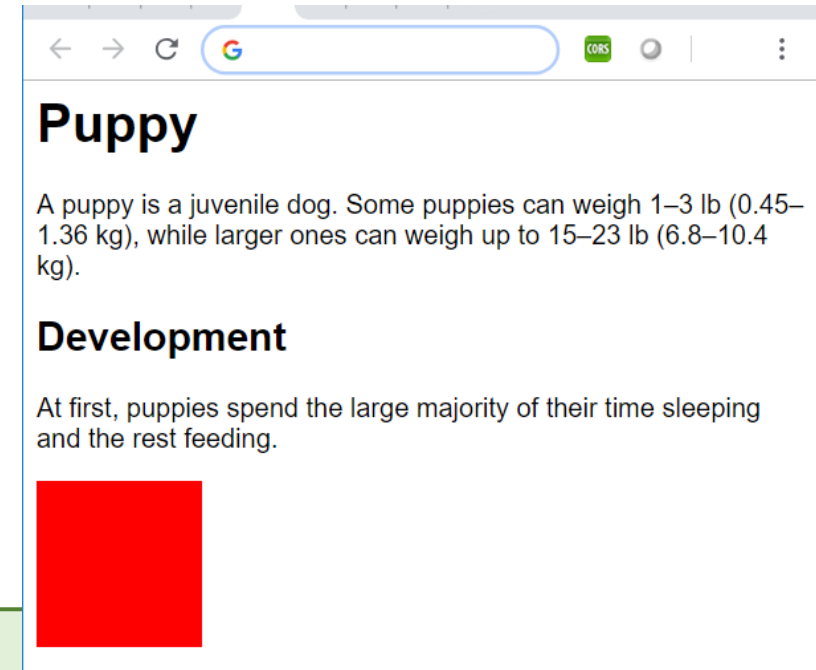

- `static` is the default value for `position`
- If you use `top/left/bottom/right` without setting non-static position, nothing will happen

```
<h1>Puppy</h1>
<p>A puppy is a juvenile dog. Some puppies can weigh 1-3 lb (0.45-1.36 kg), while larger ones can weigh up to 15-23 lb (6.8-10.4 kg).</p>
<h2>Development</h2>
<p>At first, puppies spend the large majority of their time sleeping and the rest feeding.</p>
<div id="box1"></div>
```

HTML

```
body {
  font-family: Helvetica, sans-serif;
}
#box1 {
  height: 100px;
  width: 100px;
  background-color: red;
}
```

# position: fixed

```
#menubar {  
  position: fixed;  
  top: 50px;  
  right: 100px;  
  width: 400px;  
}
```

- For **fixed positioning**, the offset is the distance positioned **relative to the viewport**.
- The element **does not move** when the webpage is scrolled.
- Element is removed from normal document flow, positioned on its own layer

Often used to implement UIs; control bars that shouldn't go away

# position: fixed

```
#box1 {  
    height: 50px;  
    background-color:  
        rgba(0, 0, 0, 0.5);  
    position: fixed;  
    top: 50%;  
    left: 0;  
    right: 0;  
}
```

CSS

[Codepen](#)

vernacular English, puppy refers specifically to dogs, while pup may often be used for other mammals such as seals, giraffes, guinea pigs, or even rats.

## Development

At first, puppies spend the large majority of their time sleeping and the rest feeding. They instinctively pile together into a heap, and become distressed if separated from physical contact with their littermates, by even a short distance.

Puppies are born with a fully functional sense of smell but can't open their eyes. During their first two weeks, a puppy's senses all develop rapidly. During this stage the nose is the primary sense organ used by puppies to find their mother's teats, and to locate their littermates, if they become separated by a short distance. Puppies open their eyes about nine to eleven days following birth. At first, their retinas are poorly developed and their vision is poor. Puppies are not able to see as well as adult dogs. In addition, puppies' ears remain sealed until about thirteen to seventeen days after birth, after which they respond more actively to sounds. Between two and four weeks old, puppies usually begin to growl, bite, wag their tails, and bark.

Puppies develop very quickly during their first three months, particularly after their eyes and ears open and they are no longer completely dependent on their mother. Their coordination and strength improve, they spar with their littermates, and begin to explore the world outside the nest. They play wrestling, chase, dominance, and tug-of-war games.

## Development

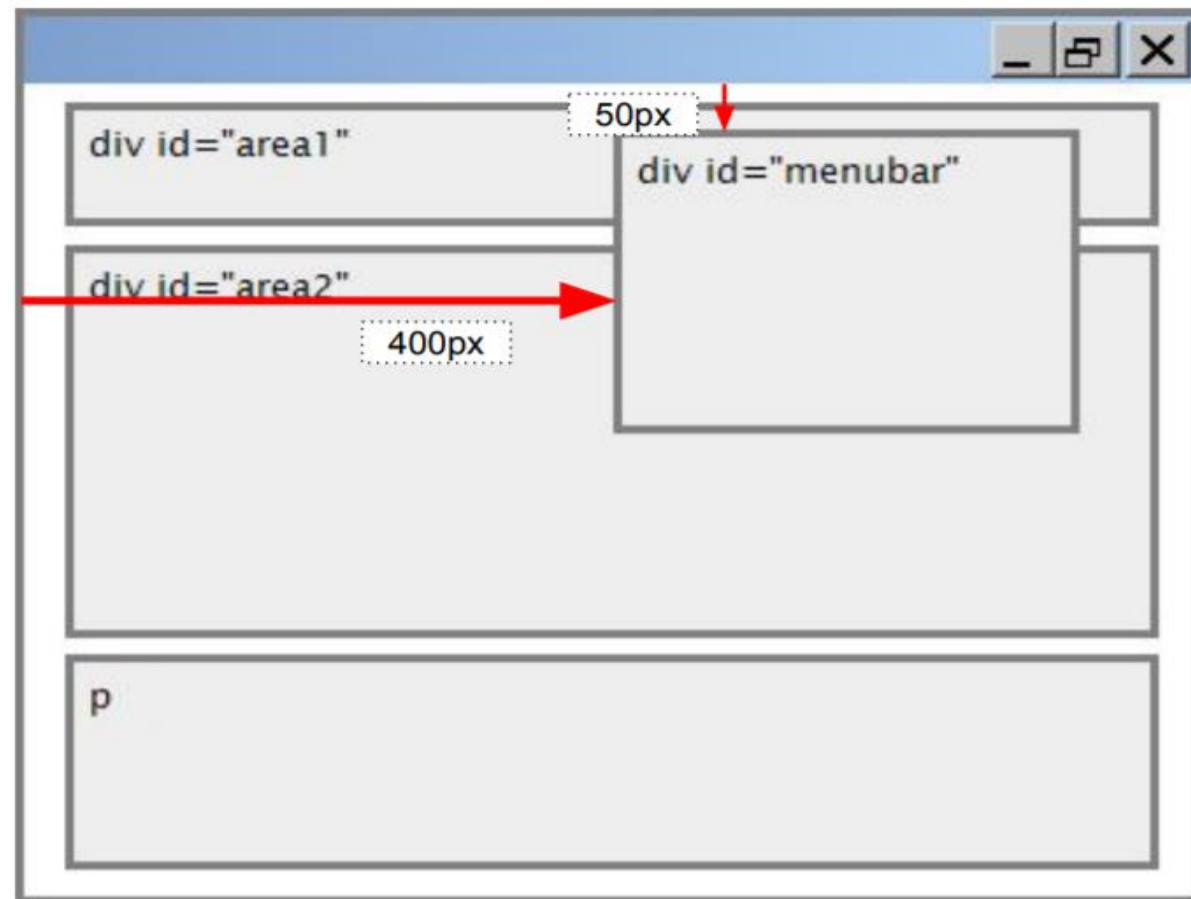

Puppies are highly social animals and spend most of their waking hours interacting with either their mother or littermates. When puppies are socialized with humans, particularly between the ages of eight and twelve weeks, they

# position: absolute

```
#menubar {  
    position: absolute;  
    left: 400px;  
    top: 50px;  
    width: 300px;  
}
```

- For **absolute positioning**, the **offset** is the distance **from the nearest positioned "ancestor element"**, if no positioned ancestor, document body is used
- Element is removed from normal document flow, positioned on its own layer

# position: absolute

```
#box1 {  
  height: 100px;  
  width: 100px;  
  background-color: red;

### Puppy

A puppy is a juvenile dog. Some puppies can weigh 1–3 lb (0.45–1.36 kg), while larger ones can weigh up to 15–23 lb (6.8–10.4 kg). All healthy puppies grow quickly after birth. A puppy's coat color may change as the puppy grows older, as is commonly seen in breeds such as the Yorkshire Terrier. In vernacular English, puppy refers specifically to dogs, while pup may often be used for other mammals such as seals, giraffes, guinea pigs, or even rats.

### Development

At first, puppies spend the large majority of their time sleeping and the rest feeding. They instinctively pile together into a heap, and become distressed if separated from physical contact with their littermates, by even a short distance.

Without top/bottom, left/right offsets, defaults to the normal flow in document: as no position was applied

# position: relative

- For `position: relative;` the element is placed **where it would normally be placed** in the layout of the page but shifted by the `top / left / bottom / right` values.

```
#box2 {  
  height: 100px;  
  width: 100px;  
  background-color: blue;  
  position: relative;  
  top: 50px;  
  left: 50px;  
}
```

CSS

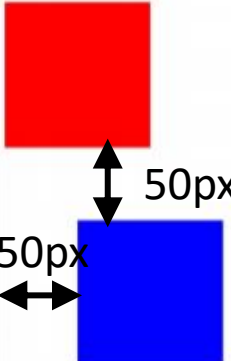

[Codepen](#)

### Puppy

A puppy is a juvenile dog. Some puppies can weigh 1–3 lb (0.45–1.36 kg), while larger ones can weigh up to 15–23 lb (6.8–10.4 kg). All healthy puppies grow quickly after birth. A puppy's coat color may change as the puppy grows older, as is commonly seen in breeds such as the Yorkshire Terrier. In vernacular English, puppy refers specifically to dogs, while pup may often be used for other mammals such as seals, giraffes, guinea pigs, or even rats.

### Development

At first, puppies spend the large majority of their time sleeping and the rest feeding. They instinctively pile together into a heap, and become distressed if separated from physical contact with their littermates, by even a short distance.

# Positioning elements with `float`

- The `float` property specifies how an element should float:
  - `left` - The element floats to the left of its container
  - `right` - The element floats to the right of its container
  - `none` - The element does not float (will be displayed just where it occurs in the text). This is default
  - `inherit` - The element inherits the `float` value of its parent
- Note: Absolutely positioned elements ignores the `float` property!
- Note: **Elements after a floating element will flow (wrap) around it**
  - to avoid this, use the `clear` property or the clearfix hack

# Positioning elements with `float`

(example without float)

- `<div>` takes the height of the containing element(s): `<p>` `<img>`

```
<h2>UCY campus</h2>
<div>
  
  <p>Welcome to the UCY campus</p>
</div>
```

HTML

```
div {
  background-color: lightblue;
}
img {
  height: 200px;
}
```

CSS

**UCY campus**

Welcome to the UCY campus

Both `<p>` and `<img>` are contained within the `<div>` so the lightblue background covers both of them.

# Positioning elements with float

(example **with** float)

- `<div>` takes the height of the containing element(s): `<p>`

```
<h2>UCY campus</h2>
<div>
  
  <p>Welcome to the UCY campus</p>
</div>
```

HTML

```
div {
  background-color: lightblue;
}
img {
  height: 200px;
  float: left;
}
```

CSS

UCY campus

Welcome to the UCY campus

`<div>`

Floated element `<img>` is not contained within the `<div>` anymore (actually `<img>` is removed from the normal document flow, and floats to the left of `<div>`) so the lightblue background covers only the `<p>` which is still contained within the `<div>`

# Positioning elements with `float`

(example **with** float)

- `<div>` takes the height of the containing element(s): `<p>`

```
<h2>UCY campus</h2>
<div>
  
  <p>Welcome to the UCY campus</p>
</div>
```

HTML

```
div {
  background-color: lightblue;
  overflow: hidden;
}
img {
  height: 200px;
  float: left;
}
```

CSS

**UCY campus**

Welcome to the UCY campus

`overflow: hidden` hides any part of an element which flow out of the parent container. At the same time, it “forces” the child elements to be contained within the parent element.

# Positioning elements with `display: flex`

```
<div class="parent">
  <div class="child">
    <h2>First paragraph</h2>
    Lorem ipsum dolor sit amet, consectetur
adipiscing elit, ...
  </div>
  <div class="child">
    <h2>Second paragraph</h2>
    Lorem ipsum dolor sit amet, consectetur
adipiscing elit, ...
  </div>
  <div class="child">
    <h2>Third paragraph</h2>
    Lorem ipsum dolor sit amet, consectetur
adipiscing elit, ...
  </div>
  <div class="child">
    <h2>Fourth paragraph</h2>
    Lorem ipsum dolor sit amet, consectetur
adipiscing elit, ...
  </div>
</div>
```

HTML

```
.parent {
  display: flex;
  flex-flow: row wrap;
}

.child {
  width: 40%;
}
```

CSS

# Basic shape

- Begin visualizing the layout in terms of boxes:

# Basic shape

- Begin visualizing the layout in terms of boxes:
- **Let's first try making this layout!**

# Content Sectioning elements

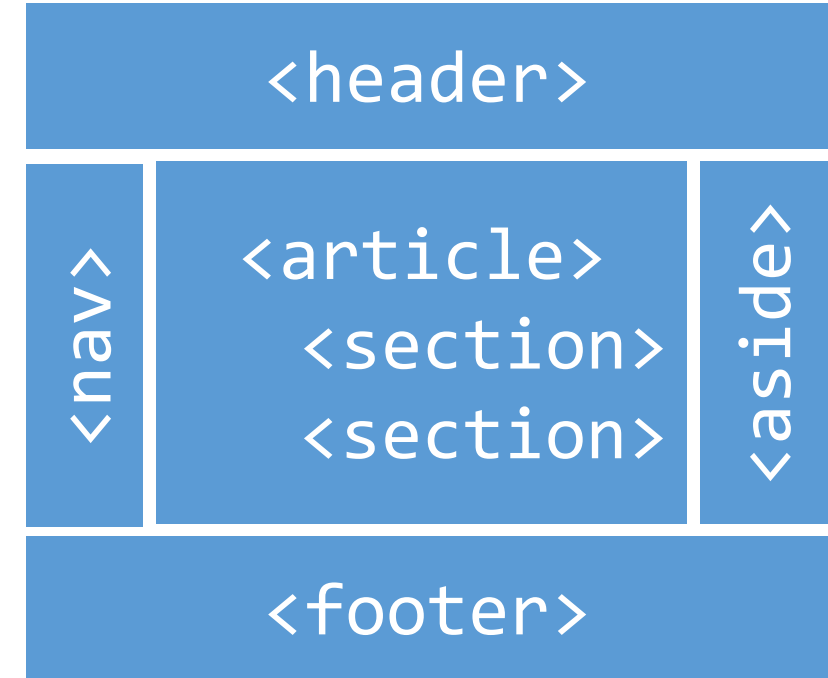

These elements do not "do" anything; they are basically more descriptive `<div>`s. Makes your HTML more readable. See [MDN](#) for more info.

Name	Description
<code>&lt;p&gt;</code>	Paragraph ( <a href="#">mdn</a> )
<code>&lt;h1&gt;</code> - <code>&lt;h6&gt;</code>	Section headings ( <a href="#">mdn</a> )
<code>&lt;article&gt;</code>	A document, page, or site ( <a href="#">mdn</a> ) This is usually a root container element after body
<code>&lt;section&gt;</code>	Generic section of a document ( <a href="#">mdn</a> )
<code>&lt;header&gt;</code>	Introductory section of a document ( <a href="#">mdn</a> )
<code>&lt;footer&gt;</code>	Footer at end of a document or section ( <a href="#">mdn</a> )
<code>&lt;nav&gt;</code>	Navigational (menu) section ( <a href="#">mdn</a> )
<code>&lt;aside&gt;</code>	Sidebar ( <a href="#">mdn</a> )

# Content Sectioning elements

- Prefer these elements to `<div>`s when it makes sense!

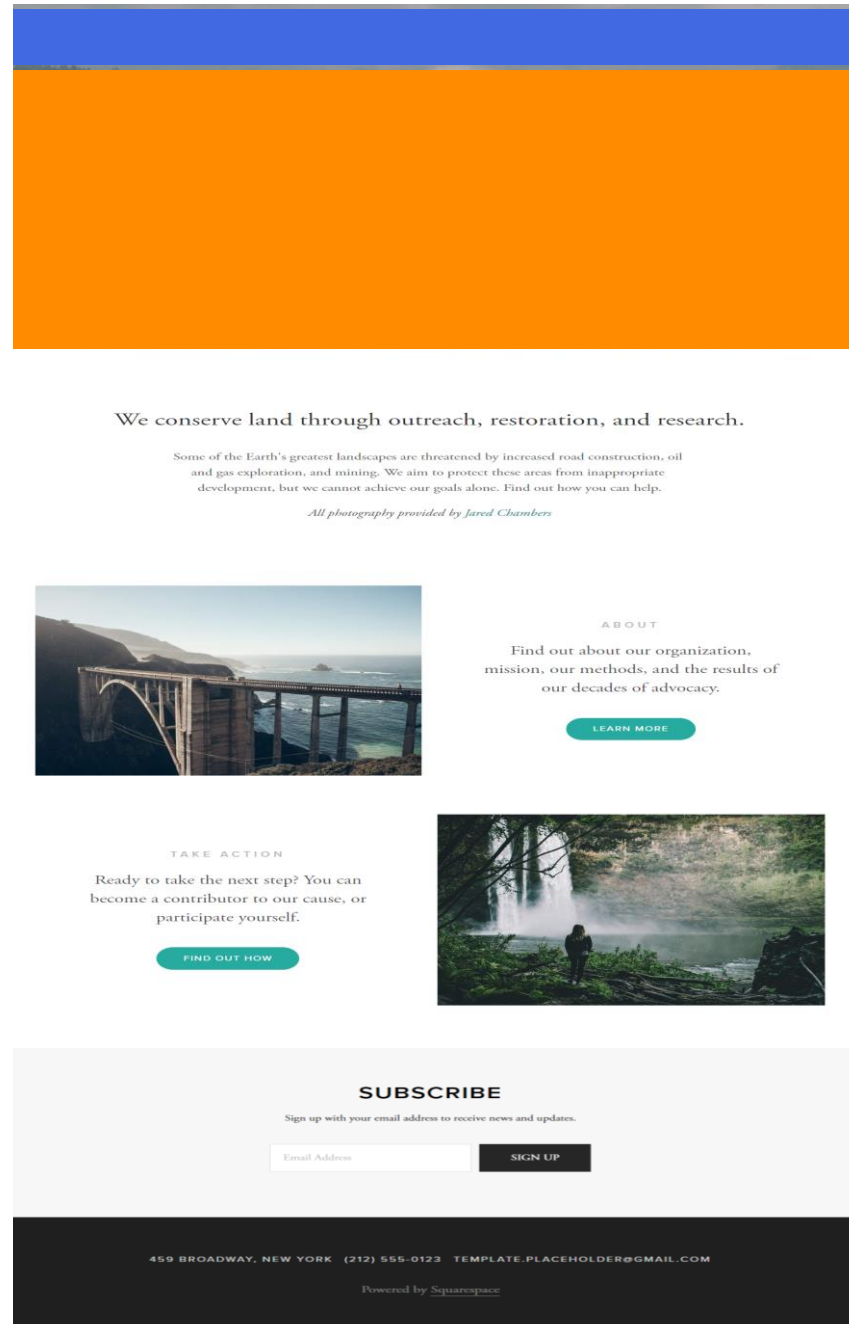

# Top

- **Navbar:**

- Height: 75px
- Background: royalblue
- <nav>

- **Header:**

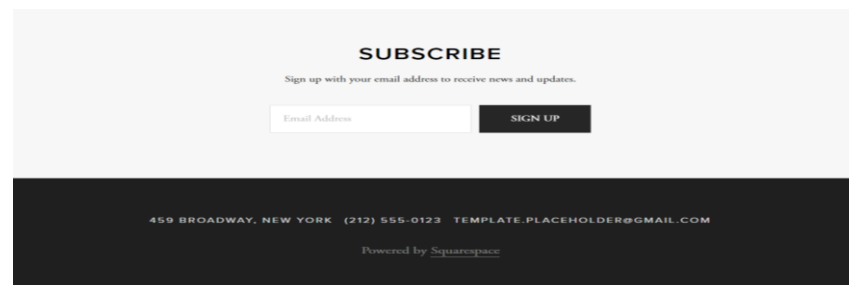

- Height: 400px;
- Background: darkorange
- <header>

# Main

- Gold box:
  - Surrounding space: 96px above and below; 32px on each side
  - Height: 990px
  - Background: gold
  - `<section>` ᅀ `<article>`

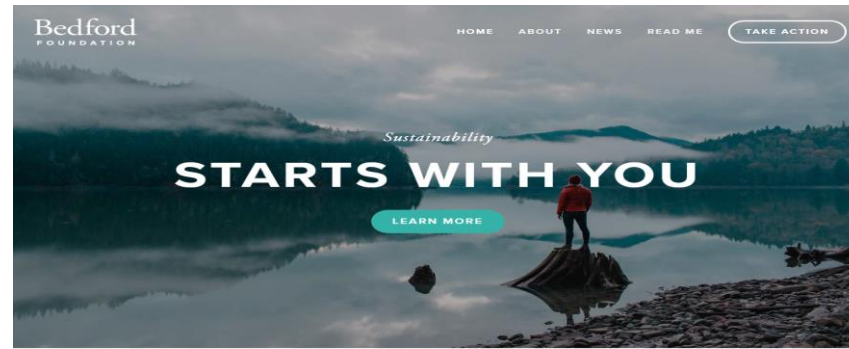

# Bottom

- Subscribe:

- Height: 310px
- Background: darkgray
- <section>

- Footer

- Height: 210px
- Background: black
- <footer>

We conserve land through outreach, restoration, and research.

FIND OUT HOW

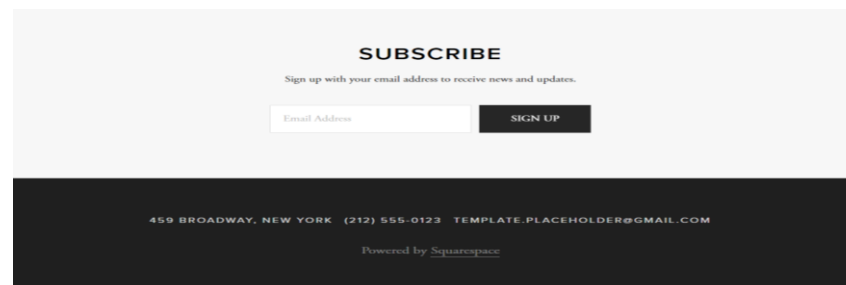

# Main contents

- Title with paragraphs:
  - Height: 290px
  - Background: khaki
  - Space beneath: 80px
  - `<h1>`, `<p>` within `<div>`
- Images and Descriptions
  - Height: 275px;
  - Width: 48% of the parent's width, with space in between
  - Horizontal space: 80px;
  - Background: forestgreen
  - `<div>`

[Codepen](#)

Can be developed using either position property (see Codepen above), or with float property.

Random useful CSS

# How to set an image within a div

- 1<sup>st</sup> way: Use `<img>` inside `<div>`

```
<div class="header">  
    
</div>
```

- 2<sup>nd</sup> way: Set it as background-image on `<div>` element

```
<div class="header">  
</div>
```

```
.header {  
  background-image: url(background.png);  
  height: 400px;  
}
```

We conserve land through outreach, restoration, and research.

# background properties

- You can then use [additional background properties](#) to further style it:
  - `background-size: cover;`
  - `background-size: contain;`
  - `background-repeat: no-repeat;`
  - `background-position: top;`
  - `background-position: center;`
  - `background-attachment: fixed;`
- ([CodePen](#): Try resizing the window)

# background-repeat property

```
.header {  
  background-image: url(https://cs.ucy.ac.cy/images/ucy_logo_en.png);  
  height: 195px;  
}
```

CSS

```
.header {  
  background-image: url(https://cs.ucy.ac.cy/images/ucy_logo_en.png);  
  background-repeat: no-repeat;  
  height: 195px;  
}
```

CSS

# background-size property

```
.header {  
  background-image: url(https://cs.ucy.ac.cy/images/ucy_logo_en.png);  
  height: 195px;  
  background-size: contain;  
}
```

CSS

University of Cyprus

Department of Computer Science

Un

De

**contain:** Scales the image as large as possible (e.g. here height to be 195px) without cropping or distorting the image (show the whole image). If space remains, another image is inserted.

# background-size property

```
header {  
  background-image: url(https://cs.ucy.ac.cy/images/ucy_logo_en.png);  
  height: 195px;  
  background-size: cover;  
}
```

CSS

University of Cyprus

Department of Computer Science

**cover:** Scales the image as large as possible without distorting the image to cover width and height. If the proportions of the image differ from the element, it is cropped either vertically or horizontally so that no empty space remains. Above image is stretched to cover whole width, even that is cropped below.

# background-attachment property

- Parallax scrolling is a web site trend where the background content (i.e. an image) is moved at a different speed than the foreground content while scrolling:
  - create a container element (e.g. a div)
  - add a background image to the container with a specific height
  - add background-attachment: fixed to create the actual parallax effect
  - other background properties can be used to center and scale the image perfectly
- See examples here:
  - W3 School: [Parallax demo](#), [No parallax](#)
  - [Codepen](#)

# background-image: Gradients

- CSS gradients let you display smooth transitions between two or more specified colors
- CSS defines two types of gradients:
  - [Linear gradients](#) (down/up/left/right/diagonally)  
`background-image: linear-gradient(direction, color-stop1, color-stop2, ...);`
  - [Radial gradients](#) (defined by the center)  
`background-image: linear-gradient(shape size at position, start-color, ..., last-color);`

# background-image: Gradients

```
#grad1 {  
  width: 200px;  
  height: 150px;  
  /* For browsers that do not support gradients */  
  background-color: red;  
  /* Standard syntax (must be last) */  
  background-image: linear-gradient(red, yellow);  
}
```

CSS

```
#grad1 {  
  width: 200px;  
  height: 150px;  
  /* For browsers that do not support gradients */  
  background-color: red;  
  /* Standard syntax (must be last) */  
  background-image: radial-gradient(circle, red,  
yellow, green);  
}
```

CSS

`<link>`  `@import`

Embed code in the `<head>` of your html

```
<link rel="preconnect" href="https://fonts.googleapis.com">
<link rel="preconnect" href="https://fonts.gstatic.com" crossorigin>
<link href="https://fonts.googleapis.com/css2?family=Roboto:ital,wght@0,100;0,300;0,400;0,500;0,700;0,900;1,100;1,300;1,400;1,500;1,700;1,900&display=swap" rel="stylesheet">
```

[Copy code](#)

Roboto: CSS classes

```
.roboto-thin {
  font-family: "Roboto", sans-serif;
  font-weight: 100;
  font-style: normal;
}

.roboto-thin-italic {
  font-family: "Roboto", sans-serif;
  font-weight: 100;
  font-style: italic;
}
```

# Aside: Fallback fonts

- Notice that the Google Font example shows a comma-separated list of values for `font-family`:

```
font-family: 'Roboto', sans-serif;
```

- Each successive font listed is a fallback, i.e. the font that will be loaded if the previous font could not be loaded
- There are also six [generic font names](#) which allows the browser to choose the font based on intent + fonts available on the OS.
- It's good practice to list a generic font at the end of all your `font-family` declarations.

# overflow property

- Sets what to do when a content is too big to fit in its element's box

## overflow: visible

Lorem ipsum  
dolor sit amet,  
consectetuer  
adipiscing elit,  
sed diam  
nonummy nibh  
euismod  
tincidunt ut  
laoreet dolore  
magna aliquam  
erat volutpat.

```
div.ex4 {  
    background-color: lightblue;  
    width: 110px;  
    height: 110px;  
    overflow: visible;  
}
```

CSS

## overflow: hidden ;

Lorem ipsum  
dolor sit amet,  
consectetuer  
adipiscing elit,  
sed diam  
nonummy nibh

## overflow: scroll; overflow: auto ;

Lorem ipsum  
dolor sit amet,  
consectetuer  
adipiscing  
elit, sed diam

Lorem ipsum  
dolor sit amet,  
consectetuer  
adipiscing  
elit, sed diam  
nonummy

- Auto only shows a scrollbar when any content is clipped
- Scroll always shows the scrollbar even if all content fits and you can't scroll it (visible but disabled).

- The overflow property **works only for block** elements **with a specified height.**

[W3School Example](#)

# overflow property

```
<div class="item">  
    
</div>  
<div class="item">In this example  
the image will float to the left.  
</div>
```

HTML

```
.item {  
  float: left;  
  width: 300px;  
  color: cyan;  
  font-size: 22px;  
}
```

CSS

# overflow property

```
<div class="item">  
    
</div>  
<div class="item">In this example  
the image will float to the left.  
</div>
```

HTML

```
.item {  
  float: left;  
  width: 300px;  
  color: cyan;  
  font-size: 22px;  
  overflow: hidden;  
}
```

CSS

In this example the image will float to the left.

# Shadow Effects

- text-shadow property

```
h1 {  
  /* [x-offset] [y-offset] [blur] [color] */  
  text-shadow: 2px 2px 5px red;  
}
```

**Text shadow effect!**

- box-shadow property

```
div {  
  /* [x-offset] [y-offset] [blur] [color] */  
  box-shadow: 10px 10px 5px grey;  
}
```

This is a div element with a box shadow effect!

# CSS Icons – Font Awesome icons

- To use [Font Awesome](#) icons, add the following line inside the <head> section of your HTML webpage:

```
<link rel="stylesheet"
href="https://use.fontawesome.com/
releases/v5.6.3/css/all.css">
```

```
<p>Some Font Awesome icons:</p>
<i class="fa fa-cloud"></i>
<i class="fa fa-heart"></i>
<i class="fa fa-car"></i>
<i class="fa fa-file"></i>
<i class="fa fa-bars"></i>
```

HTML

Some Font Awesome icons:

# CSS Icons – Google Material icons

- To use [Google Material](#) icons, add the following line inside the <head> section of your HTML webpage:

```
https://fonts.googleapis.com/icon?family=Material+Icons
```

```
<p>Some Google icons:</p>  
<i class="material-icons">cloud</i>  
<i class="material-icons">favorite</i>  
<i class="material-icons">attachment</i>  
<i class="material-icons">computer</i>  
<i class="material-icons">traffic</i>
```

HTML

Some Google icons:

# Simplicity above all else

- Always prefer simplicity.
- Other tips:
  - **Separation of concerns:** HTML should contain content NOT style, CSS should contain style NOT content
  - **Descriptive HTML tags:** Make your HTML more readable by using `<header>` e.g. instead of `<div>` when appropriate
  - **Reduce redundancy:** Try grouping styles, using descendant selectors to reduce redundancy (see past slides for details)
